

CopyDisc PROTECT

Anti-rip copy protection software

Protect your content & profits

Quick & easy, non-evasive software

No modification to original material

Continually developed and updated

Pay-Per-Burn

CopyDisc PROTECT anti-rip, copy protection software helps content owners protect their digital assets. This passive solution encapsulates video files on a DVD causing access to the content by common ripping programs to be controlled.

This is achieved by introducing copy control encapsulation in areas of the disc that are not read by DVD players during playback. Complying with the DVD standard, the original content is not modified in any way and play-back quality remains unaffected.

CopyDisc PROTECT software provides a reliable anti-rip solution when protecting DVD videos.

CopyDisc PROTECT software adds protection to the ISO image file prior to burning. Once protected the ISO files can be processed in the normal way for PC playback or for duplication. Content that is protected in this way can be burnt to disc using Verity Systems Lightning tower duplicators and with CopyDisc duplicating and publishing systems.

CopyDisc PROTECT is continually developed with enhancements and from time to time we will issue software upgrades which can be installed on top of our existing software programs so you can be assured of the very best protection at all times.

CopyDisc PROTECT

CopyDisc PROTECT protection is applied in a **pay-per-burn** basis.

Dongles (USB memory sticks) are purchased with pre-loaded blocks of burns, available in blocks of 100, 500, 1000 and 5000 burns*.

The dongle can then be uploaded with additional burns as and when required.

Easy to Use

CopyDisc PROTECT can be used with Verity Systems Lightning tower duplicators and the CopyDisc series of auto-loading duplicators and publishers.

Once the CopyDisc PROTECT software has been installed on your PC, creating a protected ISO file takes just minutes. Then simply transfer the protected ISO to your duplicators hard drive and copy as normal!

Independent Testing

Independent external testing, confirms reliable levels of protection from mass market ripping programs while also achieving full playability on DVD players.

DVD Playability Testing

Intellikey Labs, recognised by the world's top entertainment, media, manufacturing and software companies as one of the leaders in quality assurance testing for optical and digital media content, conducted detailed tests of compatibility of CopyDisc PROTECT protected DVDs.

Compatibility was tested on a 100 DVD player matrix which represents 86.40% of the DVD players sold in the US between January 2005 and December 2007. The test concluded that all DVD players tested were able to play the disc and a single version of a Microsoft® Xbox&trace; 360 was unable to load the disc. The instance of a no-load represents approximately 0.12% of DVD play back devices.

DVD Protection Level Testing

Testronic Laboratories, established as a leading independent quality assurance testing solution centre for the home entertainment industry, concluded that representative cross section of Windows® and Mac® mass marketing ripping programs tested were unable to copy the protected DVDs.

Software Security Testing

Next Generation Software Ltd. (NGS), the world leader in the discovery and publication of computer security vulnerabilities, confirmed that CopyDisc PROTECT DVD copy protection software is passive and does not load computer programs to a PC.

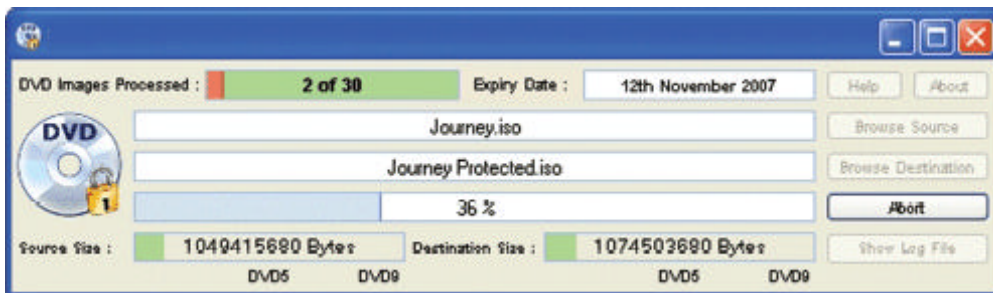

** The number of protected images (masters) that can be created is limited in proportion to the number of burns required.*

CopyDisc PROTECT

Protect your DVD-Video content with a **LIGHTNING** duplicator.

To add copy protection to DVDs duplicated on a Verity Systems DVD Lightning duplicator, could not be simpler, you just need to ensure that your tower duplicator is equipped with a USB connection and fitted with an internal hard drive.

Connect the tower to your PC via the USB and using the CopyDisc PROTECT software, create a copy protected ISO image file. Transfer the protected ISO file to the towers hard drive and then duplicate the file as normal. The resulting DVDs are copy protected and virtually impossible to duplicate.

Requirements:

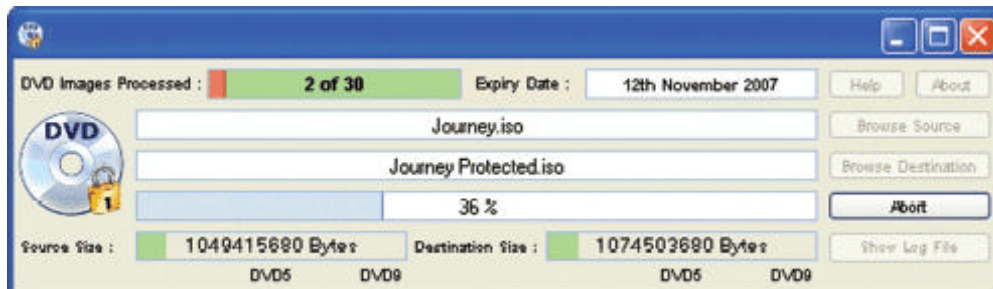

- Lightning tower duplicator
- Internal hard drive fitted
- USB 2.0 connection & cable
- PC, keyboard & mouse
- CopyDisc PROTECT software
- CopyDisc PROTECT dongle with credits

CopyDisc PROTECT

Protect your DVD-Video content with a  duplicator/publisher.

To add copy protection to video DVDs duplicated on a Verity Systems CopyDisc duplicator or publisher could not be simpler, you just need to ensure that your CopyDisc system is network ready with Verity Systems DiscPilot networking software.

With your CopyDisc connected to your network and the CopyDisc PROTECT software installed, simply create a copy protected ISO image file. Transfer the protected ISO file to the CopyDisc hard drive via the network and then duplicate the file as normal. The resulting DVDs are copy protected and virtually impossible to duplicate.

Requirements:

- CopyDisc duplicator or publisher (networked)
- DiscPilot Networking Software
- PC, keyboard & mouse
- CopyDisc PROTECT software
- CopyDisc PROTECT dongle with credits
